Abstract

In this study, the morphology and micromorphology of achenes in the species of *Ranunculus*, the largest genus in the *Ranunculaceae* in Iran, were examined for the first time. Fifty-eight species were studied through herbarium samples using a stereomicroscope, and micrographs of the surface of the pericarp were taken with a Dino-Lite Digital Microscopy (DM) system. The characters studied included the number, size, and shape of the achene, as well as the shape and size of the beak and surface ornamentation of the achene. The fruit shapes ranged from circular, oval, and egg-shaped to triangular. Surface ornamentations varied from smooth and glossy to hairy, warty, and punctate. In addition, the length of the beak was found to be an important trait for distinguishing species groups. Based on these features, species groups were identified, and a key for identifying species of *Ranunculus* based mostly on achene characteristics considering leaves and life form characters was provided. In addition, considering diagnostic characteristics, differences and relationships among species were discussed here.

Keywords: Achene ornamentation, beak shape, micromorphology, *Ranunculaceae*, species group

بررسی ریخت‌شناسی و ریز‌ریخت‌شناسی فندقه در گونه‌های آلاله در ایران

دريافت: ۱۴۰۳/۰۸/۲۲ ===== بازنگری: ۱۴۰۳/۰۹/۰۱ ===== پذيرش: ۱۴۰۳/۰۹/۰۵

خلاصه

در این مطالعه، ریخت‌شناسی و ریز‌ریخت‌شناسی میوه در گونه‌های آلاله، بزرگ‌ترین جنس آلاله‌ایان در ایران برای نخستین بار مورد بررسی قرار گرفت. میوه‌های ۵۸ گونه از نمونه‌های هرباریومی با استفاده از استریو میکروسکوپ مطالعه و به کمک سیستم عکس‌برداری میکروسکوپ دیجیتالی، میکروکروگراف‌هایی از سطح پریکارپ تهیه شد. صفات موردنیاز مطالعه شامل تعداد، اندازه و شکل میوه، شکل و اندازه منقار و تزیینات سطح میوه بود. شکل‌های میوه از دایره‌ای، بیضوی، تخم مرغی تا مثلثی مشاهده شد. تزیینات سطح میوه از صاف و صیقلی تا کرکدار، زگیل‌دار و منقوط متفاوت بود. همچنین، طول منقار از صفات مهم جهت تعیین گروه‌های گونه‌ای در نظر گرفته شد. بر این اساس، گروه‌های گونه‌ای مشخص شد و کلید شناسایی نیز با کمک ویژگی‌های میوه برای گونه‌های جنس ارایه شد. به علاوه، با استفاده از صفات تشخیصی، اختلاف و روابط گونه‌ها مورد بحث قرار گرفت.

واژه‌های کلیدی: آلاله‌ایان، تزیینات فندقه، ریز‌ریخت‌شناسی، شکل منقار، گروه گونه‌ای

Introduction

The *Ranunculus* L. is one of the largest genera in the *Ranunculaceae*, with approximately 600 species worldwide (Shehata & Turki 2001). Recently, Pakravan & Assadi (2024) reported 59 species of this genus in Iran. It has a cosmopolitan distribution but prefers damp habitats. Different species of *Ranunculus* occupy a wide range of habitats, from shallow waters to mountainous elevations and lowland plains (Pakravan & Assadi 2023). Based on habitat diversity, many structural adaptations can be observed in these plants, which enable them to grow in various environments. These adaptations result in significant variation in different plant organs, such as roots, leaves, and achenes. *Ranunculus* species exhibit growth forms ranging from annuals to perennials, with roots that can be simple, erect, fibrous or tuberous. The leaves vary from simple to palmate and pinnate in different species. The achene is an achene, arranged on a conical-shaped receptacle, and exhibits a wide range of sizes and shapes (Pakravan & Sharifinia 2023).

The first systematic review of the genus *Ranunculus* in Southwest Asia was conducted as a monograph by Boissier (1867). De Candolle (1818) also conducted studies on this family and used floral characteristics, underground organs, and achenes for taxonomic identification. Later, Cook (1966) carried out extensive studies on various characteristics of the genus. Tamura (1995) also made a comprehensive review of the *Ranunculus* genus. Several different classifications have been proposed for the genus, including Tamura's separation of several small genera from *Ranunculus* and the division of the species into three tribes (Tamura l.c.). Iranshahr *et al.* (1992) carried out extensive studies of *Ranunculaceae* for the Flora Iranica. Following this, molecular systematics and phylogenetic studies were also conducted by several scientists (Johansson 1998, Hörandle *et al.* 2005, Lehnebach *et al.* 2007, Gehrke & Linder 2009, Emadzadeh *et al.* 2010, 2011, Hörandle *et al.* 2012, Rastipisheh *et al.* 2011). Bidarlord *et al.* (2016) based on the ecological conditions and micromorphology of the fruit, reported *Ranunculus polyrhizos* Stephan ex

Willd. from Iran. Several botanists have used multiple traits to group and identify species of *Ranunculus* (De Candolle 1817, Gray 1821, Benson 1940, Hörandle & Emadzadeh 2011, 2012, Emadzadeh *et al.* 2011, Pakravan & Sharifinia 2023, Pakravan & Assadi 2024). Some botanists have classified species based on the shape of the basal leaves and the type of root. For example, Boissier (1867) identified species groups based on the shape of the sepals, root type, and leaf shape. Iranshahr *et al.* (1971) artificially classified species into groups based on root and leaf shape. One group, with fibrous roots, was placed in the rhizomatosa and praemorsa groups, while another, based on tuberous roots, was classified under the "Gromorza" group. Morphological characters of nectar scales have also been used by several botanist as an important character for distinguishing the *Ranunculus* species (Cook 1966, Nemati *et al.* 2009, Emady *et al.* 2010). However, ultimately, achene characteristics should be used for accurate species identification.

Weigand (1895) was the first to study the achene structure in the *Ranunculaceae* and provided morphological and anatomical traits for various genera within the family. Following this, Cook (1963) examined the anatomical structure of the achene in the subgenus *Batrachium* and used achene characteristics for species identification. Salim *et al.* (2016) investigated the morphology of several taxa within the *Ranunculaceae*. Jung *et al.* (2017) examined the achene and seeds of some genera within this family as well.

Trzask (1999), in his study of the wood structure in *Ranunculaceae* achenes, identified it as a useful trait for species identification. Mourad *et al.* (2000) also studied the morphology and anatomy of the achene in this family. Fruit micromorphological studies in *Thalictrum* L. species of Iran, showed significant differences between species (Pakravan *et al.* 2021). Morphometry geometric studies based on fruit were useful in distinguishing the varieties of *Ceratocephala falcata* L. (Alirezai *et al.* 2023). Shehata & Turki (2001) examined the external structure and micromorphology of the achene in *Ranunculus* species of Egypt. They investigated nine species of

Ranunculus from the said country, seven of which also grow in Iran. They primarily used patterns of pericarp cells and surface ornamentation of the pericarp to develop a species identification key for Egyptian *Ranunculus*.

However, Pakravan (2010) utilized achene structure to verify the identification of some *Ranunculus* species in Iran. Emadzade *et al.* (2010), through the study of achene morphology and anatomy in *Ranunculaceae*, and comparing their findings with molecular phylogenetic analyses, concluded that the achene structural features somewhat correspond with the placement of species on the phylogenetic tree, supporting their taxonomic classification. Seed micromorphological characters have studied in various plants families (Hoseini *et al.* 2017).

Since herbarium samples often do not include roots and sometimes even basal leaves, the aim of this research is to conduct a comparative study and identify achene traits in the *Ranunculus* species of Iran,

providing an identification key based on achene characteristics to facilitate species identification.

Materials and Methods

In this study, herbarium samples from the Faculty of Biological Sciences, Alzahra University (ALUH), Forests and Rangelands Research Institute (TARI), Kharazmi University (T, FAR), and Herbarium of Forests and Rangelands Research Department, Kermanshah (RANK), Iran were used (Table 1) (Thiers 2021). Here, about 100 specimens of 58 *Ranunculus* species from Iran were examined.

For micromorphological studies, the achenes were used without any pre-treatment. After removing dust from the surface of the achenes, they were photographed using a Digital Microscopy. Forty-five micrographs, were then selected from the obtained images, are presented in this paper. The terminology used for description of the micromorphology of the pericarp surface, was based on Davis (1965).

Results and Discussion

Based on the results obtained from the achene morphology studies, the number of achenes in each flower is an important trait for species identification. The lowest number of achenes (4–6) was observed in *R. arvensis*, while the highest number (50–80) was found in *R. sphaerospermus*. However, the results achieved here, is in agreement with Davis description in Flora of Turkey (1965).

Achene size is another significant trait in *Ranunculus* species. Among the Iranian *Ranunculus* species, *R. sphaerospermus* exhibited the smallest achene, measuring approximately 4 mm in length, while

R. pinardii had the largest achene, measuring 15 mm in length, which is here in agreement with Iranshahr et al. (1992).

The shapes of the achenes in the *Ranunculus* species were observed in the following forms: circular, ovate, ovate-oblong, triangular, and spherical.

The beak of the achene varied in shape between different species and were observed in the following forms: short and straight, short and curved, long and straight, long and curved, and long and circinate. Based on this characteristic, the species can be grouped into the following categories:

- Group 1

Twelve species fall into this category, mostly annuals or aquatic having a beak less than 0.5 mm length or without beak, including the following species: *R. sphaerospermus*, *R. trichophyllus*, *R. peltatus*, *R. rionii*, *R. ophioglossifolius*, *R. scleratus*, and *R. dolosus*; and

species that grow in alpine and cold regions, such as *R. meyerianus* (Arasbaran Mountain), *R. strigillosus* (Slopes of Sahand Mountain), *R. koeiei* (Gahvareh Mountain), *R. oreophilus* (Damavand and Sahand Mountains), and *R. polyrhizus* (Bakrodagh Mountain, Ardebil) (Table 2 & Fig. 1).

Table 2. *Ranunculus* species without beak or with a beak less than 0.5 mm length

| TAXON | ACHENE SHAPE | LENGTH WIDTH (mm) | BEAK SHAPE | BEAK LENGTH | SURFACE SCULPTURING | NO. OF ACHENE |
|--|---------------------|-------------------|------------------------------|-------------|---|---------------|
| <i>R. sphaerospermus</i> Boiss. & Blanches in Boiss. | ± Spheroidal | 0.85–0.95 | - | - | With marginal vein, striate | 50–80 |
| <i>R. trichophyllus</i> Chaix in Vill. | Elliptic | 1.3–1.5 | - | - | Striate | 15–30 |
| <i>R. peltatus</i> Schrank | ± Elliptic | 1.8–2 | Without beak, with sharp tip | - | Striate | 30–40 |
| <i>R. rionii</i> Lagger. | ± Elliptic | 1–1.4 | Without beak, with sharp tip | - | With marginal vein, striate | 60–80 |
| <i>R. ophioglossifolius</i> Vill. | Ovate | 1–1.5 | Erect | -0.4 | With marginal vein, hairy | 60–80 |
| <i>R. scleratus</i> L. | Ovate-semi circular | 1–1.3 | Erect | -0.4 | With marginal vein, wrinkled | |
| <i>R. dolosus</i> Fisch. & C.A.Mey. | Ovate-semi circular | 1 | Without beak, with sharp tip | - | With marginal vein, glabrous to ± faveolate | 50–60 |
| <i>R. meyerianus</i> Rupr. | Ovoid-oblong | 2.5–3.5 | Beak broad, triangular | 0.2–0.4 | With marginal vein, glabrous | 30–40 |
| <i>R. strigillosus</i> Boiss. & A. Huet. | Obovate | 2–2.4 | Short conical | -0.2 | With marginal vein, glabrous | 40–50 |
| <i>R. koeiei</i> Rech. f. | ± Orbicular | 1.5–2 | Straight, with ± curved tip | 0.5 | Appressed hairy | |
| <i>R. oreophilus</i> M.B. | Ovate-semi circular | 1.8–2 | Uncinate | 0.4 | With marginal and median veins, glabrous | 30–38 |
| <i>R. polyrhizus</i> Stephan ex Willd. | Obovate | 2–2.5 | Uncinate | 0.3 | Marginal winged, hairy | - |

- Group 2

Twenty-four species belong to this group, most of which grow in humid and mountainous regions having beak length between 0.5–1.5 mm including the following species: *R. lateriflorus* (Slopes of Sahand Mountain), *R. cicutarius*, *R. illyrichus*, *R. macropodioides*, *R. elymaticus*, *R. bulbilliferus* (Manishan Mountain), *R. eriorrhizus* (Lalezar Mountain), *R. amblyolobus* (Kandovan), *R. buhsei* (Northern Alborz forests), *R. cornutus* (Silvana in Zagros), *R. chius* (Poshteh Kuh in

Lorestan), *R. lingua*, *R. brachylobus* (Sabalan Mountain), *R. repens* (Kelardasht forests), *R. polyanthemos* (Arasbaran and Javaherdeh forests), *R. bulbusus* (Anbarlu forests), *R. merovensis* (Arasbaran), *R. caucasicus* (Asalem forests), *R. sericeus* (Taleghan, Peshteh Kuh), *R. grandiflorus* (Ramsar forests), *R. kotschy* (Rudbar), *R. crymophilus* (Varosht Mountain), *R. marginatus*, and *R. zenjanensis* (Kamar and Mahneshan Mountains) (Table 3 & Fig. 2).

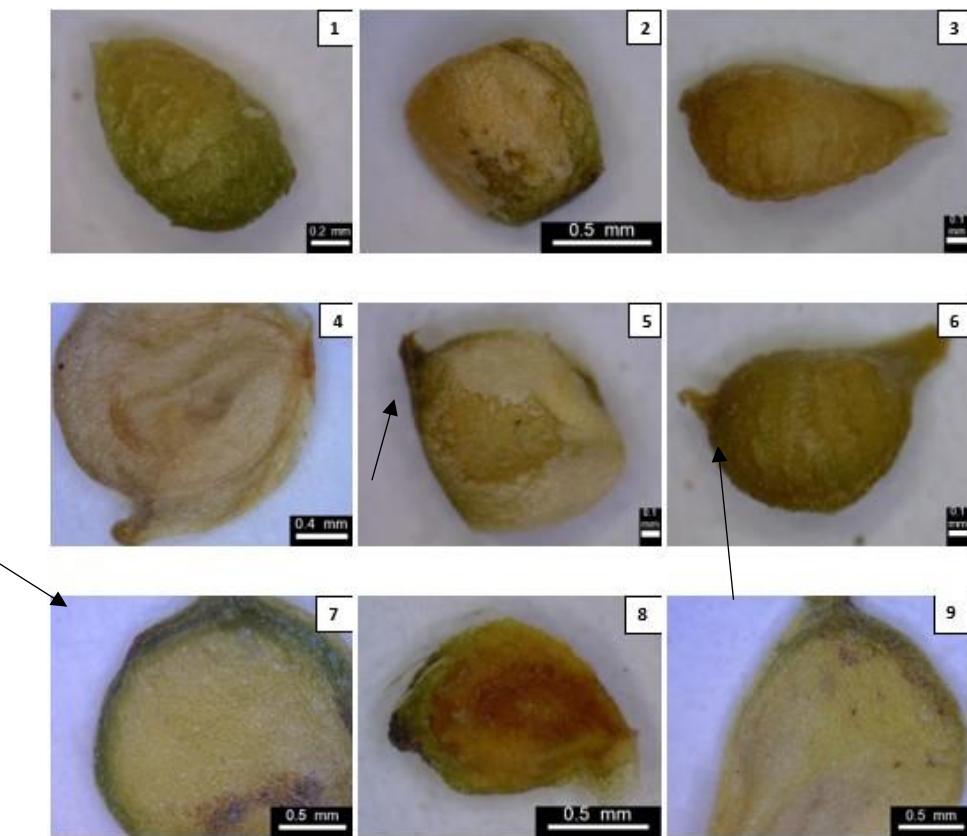

Fig. 1. Achenes of the Iranian taxa of *Ranunculus*: 1. *R. trichophyllus*, 2. *R. dolosus*, 3. *R. sphaerospermus*, 4. *R. macropodioides*, 5. *R. scleratus*, 6. *R. rionii*, 7. *R. bulbiferus*, 8. *R. ophioglossifolius*, 9. *R. amblyolobus* (arrows indicate the beak).

Table 3. *Ranunculus* species with a beak length of 0.5–1.5 mm

| TAXON | ACHENE SHAPE | LENGTH (mm) | BEAK SHAPE | BEAK LENGTH | SURFACE SCULPTURING | NO. OF ACHENE |
|--|------------------|--------------------|-----------------------------|-------------|---|---------------|
| <i>R. lateriflorus</i> DC. | Ovate-circular | 2.7–3 | Straight to slightly curved | 1.45 | With marginal vein, papillate | 25–35 |
| <i>R. cornutus</i> DC. | Ovate-elliptic | 3–6 (without beak) | Straight, with curved tip | 1.2–1.4 | Acutely muriculate, winged marginally | 4–9 |
| <i>R. chius</i> DC. | Ovate-circular | 3.5–4.5 | Broad triangular, curved | 1 | Papillate | 8–16 |
| <i>R. lingua</i> L. | Ovate-oblong | 1.5–3 | Slightly curved | 0.7 | With marginal vein glabrous | |
| <i>R. cicutarius</i> Schlechtend. | Ovoid-triangular | 3–4 | Straight to ± curved | 1.4 | With marginal vein, Punctate -alveolate | 30–40 |

- Group 3

Twenty-three species has achenes with beaks longer than 1.5 mm (Table 4). Among these species, nine have achenes with beaks longer than 2 mm, including the following species: *R. pinardii*, *R. muricatus*, *R. dalechanensis*, *R. macrorrhynchus*, *R. leptorrhynchus*, *R. sojakii*, *R. constantinopolitanus*, *R. millefolius*, and *R. procumbens*. These species mainly grow in tropical regions, except for *R. pinardii*, *R. sojakii*, and *R. constantinopolitanus*, which are found in Azarbaijan, Mazandaran, Kermanshah, and Hamedan provinces. The other species in this group have tuberous roots, indicating an adaptation to tropical and subtropical habitats. As noted

by Emadzade et al. (2010), in the dry habitats, the long, curved beaks and the presence of protuberances on the surface of the achene serve as effective tools for achene dispersal by animals.

Another important feature of the achene is its surface ornamentation. The achene surface can be smooth and glossy, striated, wrinkled, hairy, spiny, warty or perforated. Achene with hairy surfaces were observed in the following species: *R. pinardii*, *R. macrorrhynchus*, *R. sojakii*, *R. damascenus*, *R. straussii*, *R. afghanicus*, *R. termei*, *R. aucheri*, *R. tricocarpus*, *R. dalechanensis*, and *R. renzii*. Spiny achenes were observed in *R. muricatus*, *R. arvensis*, and *R. cornutus*.

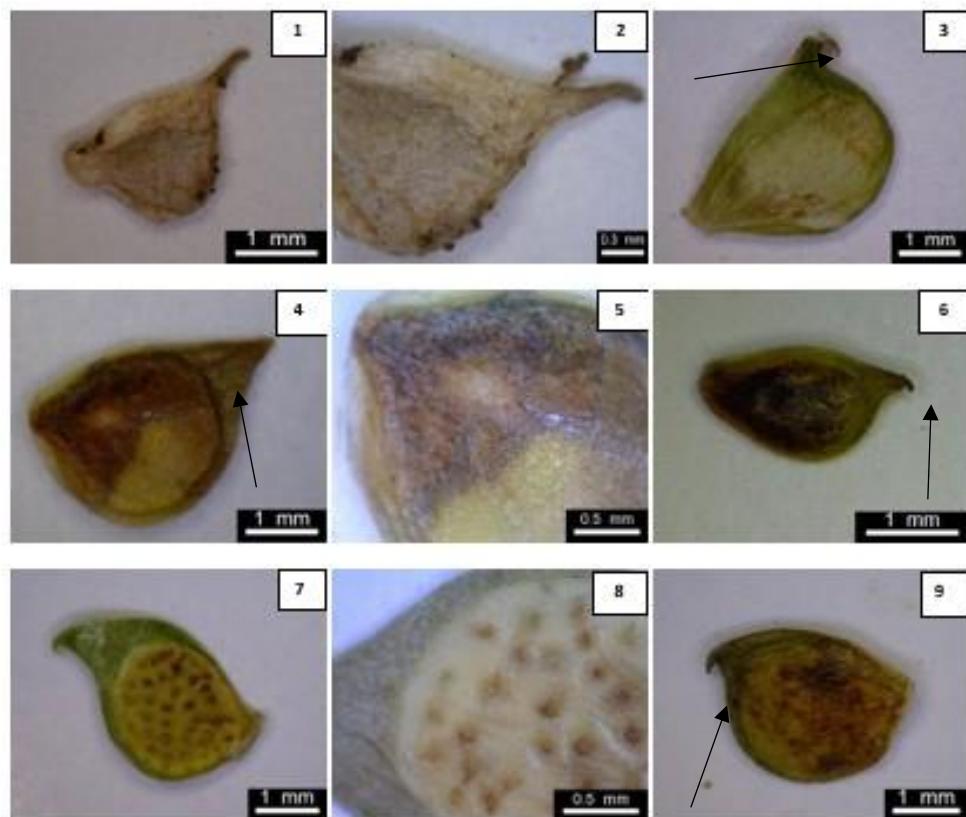

Fig. 2. Achenes of the Iranian taxa of *Ranunculus*: 1. *R. oreophilus*, 2. *R. straussii*, 3. *R. zenjanensis*, 4, 5. *R. sericeus*, 6. *R. strigulosus*, 7, 8. *R. chius*, 9. *R. grandiflorus* (arrows indicate the beak).

Tuberculated achenes were found in the following species: *R. lateriflorus*, *R. chius*, *R. marginatus*, *R. procumbens*, and *R. arvensis*. Punctate achenes were observed in *R. cicutarius*, *R. repens*, *R. kotschy*i, *R. aucheri*, and *R. millefolius*. Striated achene surfaces were observed in *R. sphaerospermus*, *R. trichophyllus*, *R. peltatus*, and *R. rionii*. The results obtained in this study are consistent with the findings of Shehata & Turki (2001) on *Ranunculus* species from Egypt.

Another characteristic of *Ranunculus* achenes is the presence of a prominent ridge along the achene's margin, composed of sclerenchyma cells. This feature is observed in most *Ranunculus* species. In the samples studied here, the marginal ridge was not distinguishable in *R. bulbilliferus*, *R. elymaticus*, and *R. merovenensis* due to immature achenes, and no marginal ridge was found in *R. brachylobus*.

Ranunculus achenes show specialized structures related to their dispersal mechanisms. For example, aquatic *Ranunculus* species (*R. trichophyllus*, *R. peltatus*, *R. rionii*, and *R. sphaerospermus*) have smooth surfaces

and are nearly beakless. The prominent marginal ridge is the area where the achene splits, allowing water to enter the achene, which facilitates seed germination (Emadzade *et al.* 2010). In contrast, in xerophytic species, where seed dispersal occurs via epizoochory, the achenes have beaks and often possess rough surfaces, such as hairs, spines or protuberances, which enhance dispersal by animals (Emadzade *et al.* l.c.).

Achene characteristics are valuable tools for distinguishing closely related species. For example, *R. pinardii*, with its 5–8 large achenes and a very long, curved beak, is easily distinguishable from other species. *R. termei* and *R. macropodioides*, both of which have tuberous roots and divided leaves, can only be differentiated by the achene surface ornamentation: *R. macropodioides* has smooth, swollen achenes, while *R. termei* has hairy and flat achenes. Additionally, the two aquatic species *R. sphaerospermus* and *R. rionii*, both of which are submerged aquatic plants with divided leaves, can be differentiated by the presence of hairs on the achenes of *R. sphaerospermus* and the absence of hairs in

R. rionii. The two species of *R. zenjanensis* and *R. renzii*, which grow in mountainous regions and have short stems and pinnately divided leaves, can be distinguished by the length and shape of the achene beak (straight in *R. renzii*

and curved in *R. zenjanensis*), and the presence or absence of hairs on the achene (hairless in *R. zenjanensis* and hairy in *R. renzii*).

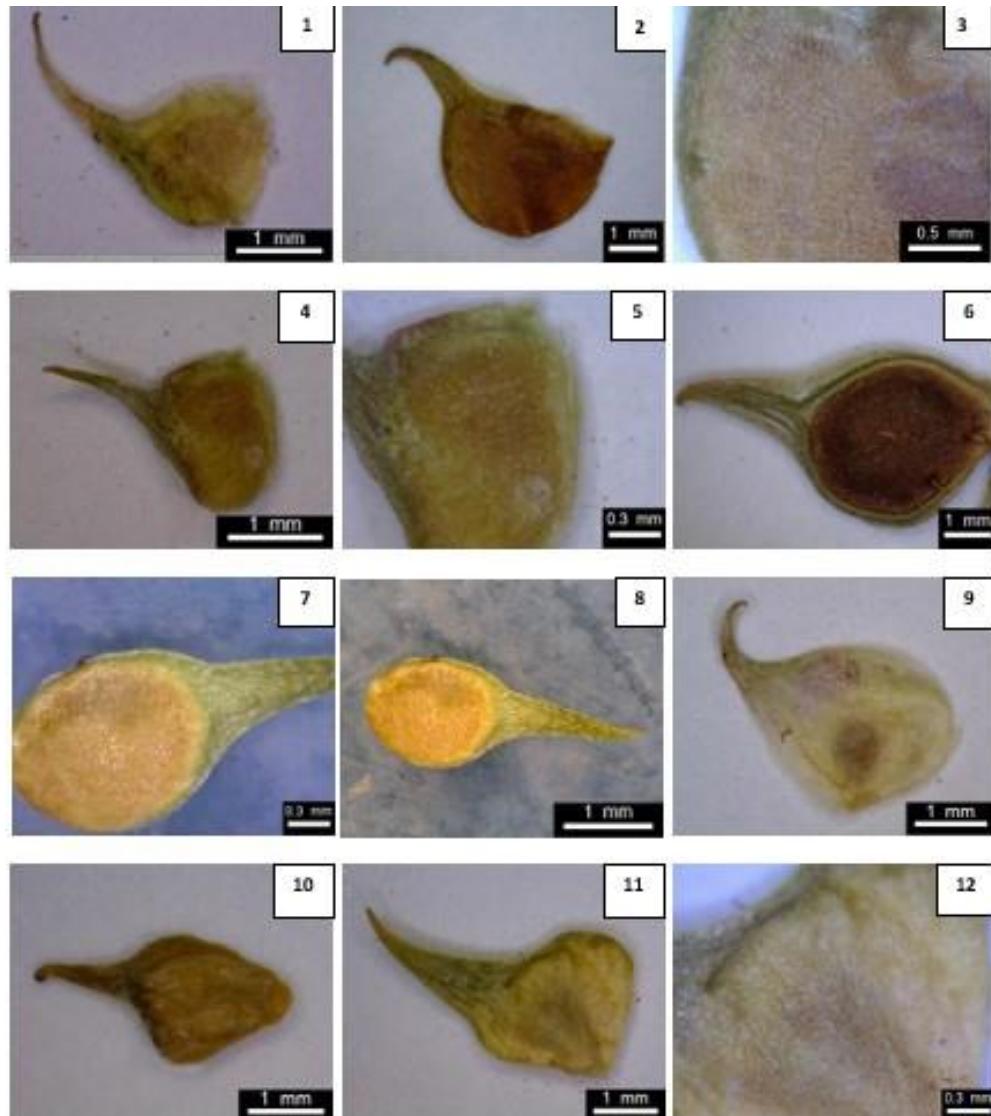

Fig. 3. Achenes of the Iranian taxa of *Ranunculus*: 1. *R. leptorrhynchus*, 2, 3. *R. constantinopolitanus*, 4, 5. *R. cicutarius*, 6. *R. marginatus*, 7, 8. *R. lateriflorus*, 9. *R. asiaticus*, 10. *R. oxyspermus*, 11, 12. *R. millefolius*.

Table 4. *Ranunculus* species with a beak length more than 1.6 mm

| TAXON | ACHENE SHAPE | LENGTH (mm) | BEAK SHAPE | BEAK LENGTH | SURFACE SCULPTURING | NO. OF ACHENE |
|--------------------------------------|-----------------|-------------|------------|-------------|---------------------------------|---------------|
| <i>R. procumbens</i> Boiss. | ± Ovoid | 6–7 | Curved | 3–4 | With marginal vein, tuberculate | 30–45 |
| <i>R. sahandicus</i> Boiss. & Buhse | ± Ovoid | 4–5 | Circinate | 1.5–2 | With marginal vein, glabrous | 30–40 |
| <i>R. microflorus</i> Pakravan | Obovate | 3–4.5 | Straight | 1.5–2 | With marginal vein, glabrous | 20–30 |
| <i>R. renzii</i> Iranshahr & Rech.f. | Rounded-obovate | 4 | Uncinate | 2 | With marginal vein, hairy | 10–17 |

Table 4 (contd)

| | | | | | | |
|---|-----------------------------|------------------------|---|---------|---|-------|
| <i>R. oxypermus</i> Willd. | Obovate | 2.5–4 | Straight | 2 | With marginal vein and winged, hairy | 40–50 |
| <i>R. damascenus</i> Boiss. & Gaill. | Obovate | 2.5–4 | Straight | 2 | With marginal vein and winged, hairy | 40–50 |
| <i>R. asiaticus</i> L. | Rounded-obovate | 3–4 | Straight curved at tip | 1–5 | With marginal vein and winged, glabrous | 40–50 |
| <i>R. straussii</i> Bornm. | Triangular-obovate | 2.5–4 | Straight | 2 | With marginal vein, reticulate, hairy | 40–50 |
| <i>R. afghanicus</i> Aitch. & Hemsl. | Rounded-obovate | 3–4 | Straight with ± curved tip | 2 | With inconspicuous marginal vein, hairy | 30–40 |
| <i>R. termei</i> Iranshahr & Rech.f. | Triangular-convex | 4 | Straight with ± curved tip | 1.5–2 | With marginal vein, hairy, reticulate | 40–50 |
| <i>R. aucheri</i> Boiss. | Broadly ovate to triangular | 2–3.5 | Straight with ± curved tip | 1.5–2 | With marginal vein, faveolated, hairy | 30–40 |
| <i>R. millefolius</i> Banks & Sol. | Triangular | 2–4 | Straight with ± curved tip | 1.5–3 | Triangular, humped at the base, with marginal vein, punctate | 30–40 |
| <i>R. brutius</i> Ten. | Orbicular | 5 | Circinate | 2 | With marginal vein, glabrous | 20–25 |
| <i>R. constantinopolitanus</i> (DC.) d'Urv. | Semi orbicular | 3.5–5 | Uncinate | 1–3.5 | With marginal vein, glabrous | 20–25 |
| <i>R. diversifolius</i> Gilib. | Semi orbicular | 4 | Uncinate | 1.5–2 | With marginal vein, glabrous | 20–25 |
| <i>R. sojakii</i> Iranshahr & Rech.f. | Rounded-obovate | 3–6 | Circinate | 0.7–3.5 | With marginal vein, hairy | 12–20 |
| <i>R. tricocarpus</i> Boiss. & Kotchy | Obovate | 4 | Uncinate | 1.5–2 | With marginal vein, hairy | |
| <i>R. leptorrhynchus</i> Aitch. & Hemsl. | Rounded-obovate | 4–6 | Straight curved at tip | 2–3 | Punctate, wrinkled in margin, glabrous, with marginal vein inflated | 40–50 |
| <i>R. acrorrhynchus</i> Boiss. | Semi orbicular | 5.7–7 | Straight curved at tip | 3–4 | With marginal vein, hairy | 20–30 |
| <i>R. dalechanensis</i> Iranshahr & Rech.f | Semi orbicular | 3–4 | Uncinate | 2–4 | With marginal vein, hairy | - |
| <i>R. arvensis</i> L. | Obovate | 5–8 | Without beak or with a lanceolate spine like beak | 0–2 | Smooth or spiny or wrinkled, tuberculate | 4–6 |
| <i>R. muricatus</i> L. | Rounded-obovate | 3–8 | Lanceolate-uncinate | 1.5–3 | With marginal vein, with sharp projection | 15–20 |
| <i>R. pinardi</i> Boiss. | Rounded-obovate | 21–23 (including beak) | Straight curved at tip | 15 | With marginal vein, hairy, tuberculate | 5–8 |

Fig. 4. Achenes of the Iranian taxa of *Ranunculus*: 1. *R. renzii*, 2. *R. leptorrhynchus*, 3. *R. sojakii*, 4, 5. *R. termei*, 6. *R. procumbens*, 7. *R. pinardii*, 8. *R. muricatus*, 9. *R. aucheri*, 10, 11. *R. tricocarpus*, 12. *R. afghanicus*.

Two alpine species of *R. kotschy* and *R. polyanthemos*, with divided leaves and hairy surfaces, can be distinguished by the type of achene ornamentation while *R. kotschy* has a punctate surface, and *R. polyanthemos* has a smooth surface. Additionally, *R. merovensis* and *R. caucasicus*, both of which have divided leaves and a similar hairy indumentum, grow in alpine regions and can be distinguished by achene size and beak length. *R. caucasicus* has larger achenes with a long, sickle-shaped beak, while *R. merovensis* has a straight

beak. *R. damascenus*, which shares a habitat with *R. oxyspermus* and is sometimes considered a subspecies of it by some botanists, can be differentiated from *R. oxyspermus* by its hairy achenes and curved beak. Therefore, based mostly on the traits derived from morphological and micromorphological studies of *Ranunculus* achenes considering leaves and life form characters, the following identification key is provided with the help of these features:

Diagnostic key to *Ranunculus* taxa in Iran

1. Achene without beak or with a beak less than 0.3 mm long 2
- Achene with conspicuous beak, more than 0.3 mm long 11
2. Achene without beak 5
- Achene with a beak less than 0.3 mm length 3

| | |
|---|--------------------------------|
| 3. Beak obtuse, plant perennial | 41. <i>R. meyerianus</i> |
| - Beak acute | 4 |
| 4. Plant perennial | 56. <i>R. strigillosum</i> |
| - Plant annual | 11. <i>R. scleratus</i> |
| 5. Achene surface without prickle | 6 |
| - Achene surface with prickle | 14. <i>R. arvensis</i> |
| 6. Achene surface tuberculate | 6. <i>R. ophioglossifolius</i> |
| - Achene surface without tubercle | 7 |
| 7. Plant terrestrial | 12. <i>R. dolosus</i> |
| - Plant aquatic | 8 |
| 8. Leaves biform | 3. <i>R. peltatus</i> |
| - Leaves uniform | 9 |
| 9. Number of achenes more than 50 | 10 |
| - Number of achenes less than 50 | 2. <i>R. trichophyllus</i> |
| 10. Achenes glabrous, nectar scale pyriformis | 1. <i>R. sphaerospermus</i> |
| - Achenes hairy, nectar scale lunate | 4. <i>R. rioni</i> |
| 11. Achene beak less than 1.5 mm length | 12 |
| - Achene beak more than 1.5 mm length | 41 |
| 12. Annual | 38 |
| - Perennial | 13 |
| 13. Perennial with fleshy root | 32 |
| - Perennial without fleshy root | 14 |
| 14. Leaves simple | 15. <i>R. lingua</i> |
| - Leaves compound with various shape | 15 |
| 15. Leaves pinnately divided..... | 16 |
| - Leaves not pinnately divided..... | 17 |
| 16. Stem glabrous | 57. <i>R. cymophilus</i> |
| - Stem hairy | 59. <i>R. zenjanensis</i> |
| 17. Leaf segments sessile | 18 |
| - Leaf segments petiolated | 24 |
| 18. Achene without beak or with a short and erect beak | 19 |
| - Achene with curved beak | 22 |
| 19. Stem tuberously thickened proximally | 43. <i>R. bulbosus</i> |
| - Stem never forming proximal tuberous thickenings | 20 |
| 20. Plant glabrous. Achene with strip-like hairs | 44. <i>R. polyrhizus</i> |
| - Plant with patule-pilose or villose indumentums. Achene glabrous | 42. <i>R. polyanthemos</i> |
| 21. Achene surface punctate. Plant tall, covered with long hairs. Petiole rather long | 54. <i>R. kotschyii</i> |
| - Achene surface smooth. Plant dwarf, covered with short and scabrous hairs. Petiole short | 39. <i>R. oreophilous</i> |
| 22. Rhizome long. Stem ascending and glabrous. Calyx glabrous | 37. <i>R. brachylobus</i> |
| - Rhizome short. Stem erect and hairy. Calyx hairy | 35. <i>R. amblyolobus</i> |
| 23. Middle segments of basal leaves with a short-broadened petiole, lateral segments sessile | 36. <i>R. buhsei</i> |
| - Middle segments of basal leaves with long petiole, lateral segments with short petiole or sessile | 24 |
| 24. Stem creeping | 40. <i>R. repens</i> |
| - Stem not creeping | 25 |
| 25. Plant covered with silky hairs | 51. <i>R. sericeous</i> |
| - Plant without silky hairs | 26 |
| 26. Achene hairy | 52. <i>R. grandiflorous</i> |
| - Achene glabrous | 27 |
| 27. Flower small, less than 1 cm width | 53. <i>R. microflorous</i> |
| - Flowers large, more than 1 cm width | 28 |
| 28. Achene beak circinate, 2–4 mm long. Leaves large | 45. <i>R. brutius</i> |
| - Achene beak curved but not circinate | 29 |
| 29. Achene beak less than 1 mm long | 46. <i>R. merovenis</i> |
| - Achene beak more than 1 mm long | 30 |
| 30. Root not fleshy | 31 |
| - Root fleshy | 32 |
| 31. Leaves 3–5 partite, middle segment sessile or with short stalk | 47. <i>R. diversifolius</i> |
| - Leaves tripartite, middle segment long petiolate | 48. <i>R. caucasicus</i> |
| 32. Sepals recurved | 20. <i>R. cicutarius</i> |
| - Sepals spreading or divergent | 33 |
| 33. Leaf segments long petiolated | 34 |

| | |
|--|------------------------------------|
| - Leaf segments sessile | 21. <i>R. illyrichus</i> |
| 34. Achene rounded, papery and flat | 26. <i>R. macropodioides</i> |
| - Achene not rounded with convex surface | 35 |
| 35. Leaves with a bulb at the axis (a swollen fleshy tissue) | 31. <i>R. bulbiferous</i> |
| - Leaves without a bulb at the axis | 36 |
| 36. Sepals persistent | 27. <i>R. elymaticus</i> |
| - Sepals deciduous | 37 |
| 37. Achene slightly swollen | 34. <i>R. eriorrhizus</i> |
| - Achene compressed | 28. <i>R. koeiei</i> |
| 38. Leaves entire, dentate or undulate margin | 5. <i>R. laterifolius</i> |
| - Leaves divided | 39 |
| 39. Basal leaves circular or renal with shallow lobes and dentate margin. Flowers 5–7 mm in diam. Peduncles bent in fruiting stage | 10. <i>R. chius</i> |
| - Basal leaves three parted, simple or compound. Flowers larger than above mentioned. Peduncle straight | 40 |
| 40. Achene with acute projection | 9. <i>R. cornatus</i> |
| - Achene with tubercles, with navicular margin and straight beak less than 1 mm long | 7. <i>R. marginatus</i> |
| 41. Achene with sharp projection | 8. <i>R. muricatus</i> |
| - Achene without sharp projection | 42 |
| 42. Achene with a beak less than 2 mm long | 43 |
| - Achene with a beak more than 2 mm long | 53 |
| 43. Plant with fleshy root | 46 |
| - Plant without fleshy root | 44 |
| 44. Leaves pinnately divided | 58. <i>R. renzii</i> |
| - Leaves not divided pinnately | 45 |
| 45. Achene glabrous | 38. <i>R. sahandicus</i> |
| - Achene hairy | 50. <i>R. tricocarpus</i> |
| 46. Sepals recurved | 47 |
| - Sepals spreading or divergent | 50 |
| 47. Leaves three parted up to near the base | 48 |
| - Leaves compound, segments long petiolate | 49 |
| 48. Fruiting head oblong, 5–6 mm width. Achene with erect beak, hairy | 16. <i>R. oxypermus</i> |
| - Fruiting head oval shape, 6–7 mm width. Achene with bent beak | <i>R. damescens</i> |
| 49. Achene rounded, papery and flat, with smooth surface. Beak up to 1.3 mm long | 26. <i>R. macropodioides</i> |
| - Achene not rounded, with convex reticulate surface. Beak up to 2 mm long | 24. <i>R. termei</i> |
| 50. Flowers red | 30. <i>R. asiaticus</i> |
| - Flowers yellow | 51 |
| 51. Achene slightly swollen | 33. <i>R. straussii</i> |
| - Achene compressed | 52 |
| 52. Leaves simple with shallow lobes | 22. <i>R. afghanicus</i> |
| - Leaves simple divided up to near the base of leaf or compound | 23. <i>R. aucheri</i> |
| 53. Plant annual | 13. <i>R. pinardi</i> |
| - Plant perennial | 54 |
| 54. Root fleshy | 56 |
| - Root not fleshy | 54 |
| 55. Achene hairy | 49. <i>R. sojakii</i> |
| - Achene glabrous | 56 |
| 56. Leaves large, with petiolated segments. Achene beak circinate | 45. <i>R. brutius</i> |
| - Leaves with sessile segments. Achene beak uncinated | 55. <i>R. constantinopolitanus</i> |
| 57. Achene hairy | 58 |
| - Achene glabrous | 59 |
| 58. Achene beak erect. Stem glabrous | 32. <i>R. dalechensis</i> |
| - Achene beak curved, with projection at the base. Stem hairy | 18. <i>R. macrorrhynchus</i> |
| 59. Achene obtusely obtriangular, with a short basal appendage | <i>R. millefolius</i> |
| - Achene not as above | 60 |
| 60. Achene surface tubercled, beak 3–4 mm long | <i>R. procumbens</i> |
| - Achene surface reticulated, beak 2–3 mm long | 25. <i>R. leptorrhynchus</i> |

Acknowledgments

The authors would like to thank the curator of herbaria of Forests and Rangelands Research Institute

(TARI) and Kharazmi University (T, FAR), Iran for providing the plant materials.
